

Technical briefing — Quotation module Vanuit Ambacht

Version: 1.1 · 1 August 2026 **Client:** Vanuit Ambacht (Tim & Bram) · info@vanuitambacht.nl **Attachments:** Vanuit-Ambacht-offerte-template.html (approved design, self-contained file with embedded fonts and images) and Offerte-0F-2026325-Bjorn-Valk-nieuw-ontwerp.pdf (reference output)

1. Goal and scope

Vanuit Ambacht no longer wants to lay out quotations by hand. The supplied HTML design is the approved end result and must be turned into a quotation module **inside Vanuit Ambacht's existing dashboard** — no standalone application, login or storage layer needs to be designed; the module plugs into what is already there.

Scope of this phase:

1. Convert the supplied HTML template into a dynamic template with input fields that generates a pixel-perfect PDF (identical to the reference PDF).
2. Make page 3 ("Uw configuratie" / configuration) fully dynamic.
3. Make images uploadable, where every photo is automatically displayed at a fixed size inside its frame, regardless of the resolution or dimensions of the supplied file.
4. Make the line items on the "Investeren" (investment) page dynamic, including automatic totals calculation.
5. **Digital approval button:** the customer receives a link, views the quotation online and gives legally valid approval there (see chapter 7).

Explicitly out of scope, but anticipated (phase 2): automatically drafting a quotation based on Plaud call transcripts and Gmail correspondence. See chapter 11 — the architectural choices in this briefing (in particular the JSON data model as the single interface) are designed so phase 2 can hook in later without rework.

2. Recommended architecture

The template is built as a single HTML file with six A4 pages (210 × 296.7 mm, @page { size: A4; margin: 0 }) and is designed to be printed to PDF via headless Chromium. Recommendations:

- **Templating:** add placeholders/loops to the HTML using a template engine of choice (Handlebars, Twig, Blade, Jinja2, React — free choice, as long as the generated HTML stays identical to the design).
- **PDF generation:** headless Chromium (Puppeteer/Playwright, or Browsershot in a PHP environment) with `printBackground: true`, A4 format, zero margins. **Do not use** wkhtmltopdf or dompdf: they do not render the CSS correctly (grids, `object-fit`, custom fonts).
- **Input:** a quotation form inside the existing dashboard that fills the JSON model from chapter 3. Default texts are pre-filled and editable per quotation. Build the generation step as a separate service/function with the JSON model as its input ("JSON in → PDF + online quotation out"), so phase 2 can use the same entry point.
- **Fonts:** Montserrat and Playfair Display are embedded in the template as base64 woff2 (both open licence, SIL OFL). Load nothing externally; PDF generation must work without an internet connection.
- **Output file name:** Offerte-`{number}`-`{customer name}`.pdf (spaces → hyphens).

3. Data model

One JSON object per quotation. All visible variable text comes from this model; no customer or product data is hardcoded in the template. This model is also the interface for phase 2.

```

Notes (field names are Dutch on purpose — they match the template and the customer-facing document; do not translate them):

- **bedrijf** is global configuration (set once, not per quotation).
- **All default texts** (intro paragraphs, USP cards, process steps, checklist, terms line, CTA texts) live in the module as defaults and can be overridden per quotation. The texts in the reference PDF are the defaults.
- **The town/city name is a variable that recurs in several places:** "Bezorging {plaats}" (line-item title), "Gratis bezorgd in {plaats}" (configuration), "Bezorging in {plaats}" (process step 4) and "Gratis bezorging in {plaats}" (investment checklist). Entered once with the customer details, applied everywhere automatically.
- **Dates** are stored as ISO dates and rendered as "21 juli 2026" (Dutch notation, written out).

4. Page 3 — "Uw configuratie" (dynamic)

This page consists of five components, each driven by the data model:

- a. Stat tiles (top).** Always exactly 4 tiles, each with `label` (uppercase, small), `waarde` (serif, large) and `sub` (small clarification). The four tiles alternate between two green tints (CSS `nth-child`, already in the template). Labels and values are free text; validation: `waarde` max ± 16 characters so it never wraps.
- b. Specification sections (left column).** Repeater: 1 to 5 sections; each section has a `titel` (rendered as the uppercase heading with the ruled line) and 1 to 4 `regels` (each rendered with the check icon). Sections and lines can be freely added/removed/reordered in the form. Soft limit: ± 12 lines in total, otherwise the column no longer fits the page (see chapter 8).
- c. Photo (right column, top).** Upload field, fixed frame 62 × 42 mm — see chapter 5.
- d. Layout diagram (right column, middle).** Optional (`tonen: true/false`). Generated from `segmenten`: an array of 2 to 6 blocks, each `type: "kastje"` (cabinet: rectangle with door icon) or `type: "uitsparing"` (recess: dark green block with circle), plus a free label. The recess block gets a slightly wider grid column (factor 1.25 — see `.units` in the template). The measure line below shows `0` on the left and `{totale_breedte_cm}` cm on the right. If `tonen: false`: hide the block and let the photo/infobox move up.
- e. Infobox (right column, bottom).** Optional; `titel` + `tekst` (max ± 220 characters). Intended for a short material or product note.

5. Images — upload and automatic display

Principle: every photo position in the template is a frame with fixed dimensions. The user uploads any photo; the system ensures it always fills the frame completely, without distortion and without white edges — regardless of resolution, aspect ratio or orientation of the source file.

Display technique (already in the template): every frame has a fixed `width / height` in mm with `object-fit: cover`; `object-position: center`. The photo is therefore centre-cropped to the frame, never stretched. The developer only needs to keep this CSS intact and fill the `src` dynamically.

Frames in the template:

Position	Frame (w × h)	Ratio	Recommended minimum source
Cover, photo strip (3×, full bleed)	± 69.5 × 52 mm	1.34 : 1	1000 × 750 px per photo
Page 2, team photo card	58 × 30 mm	1.93 : 1	800 × 420 px
Page 3, configuration photo	62 × 42 mm	1.48 : 1	900 × 610 px

Server-side processing on upload (mandatory):

1. Accept JPG, PNG, WebP and HEIC; maximum 20 MB per file.
2. Apply EXIF orientation (otherwise phone photos end up sideways), then strip EXIF data.
3. Convert to JPEG (sRGB), resize longest side to 1600 px, quality ± 85. This keeps the PDF under ± 3 MB.
4. Show a warning (do not block) if the source is smaller than the recommendation in the table above: the photo will print blurry.

- Optional but desirable: a simple focal-point picker (draggable point) translated to `object-position`, so that with strongly deviating ratios the most important part of the photo stays in view. Default: centre.

Defaults: the three cover photos and the team photo have default images (current images in the template) that can be replaced per quotation; the configuration photo is set per quotation.

6. "Investerings" page — dynamic line items

Line items. Repeater of 1 to n lines, each with:

- `titel` (bold, single line)
- `omschrijving` (optional, small grey, max ± 220 characters)
- `aantal` (integer, ≥ 1)
- `prijs_incl` (amount incl. VAT, 2 decimals; line total = $\text{aantal} \times \text{prijs_incl}$)
- `btw_pct` (default 21; adjustable per line for possible 9%/0% lines)
- `inbegrepen` (boolean). When `true`, the amount column shows the green label **"Inbegrepen"** (included) instead of "€ 0,00", and the line does not count towards the totals.

Totals — always calculated, never entered manually:

```
excl_per_line = line_total_incl / (1 + btw_pct/100)
total_excl    = sum(excl_per_line)                → round to 2 decimals
total_incl    = sum(line_total_incl)
vat           = total_incl - total_excl            → reconciled on the total
```

Render amounts in Dutch notation: € 3.495,00 (dot as thousands separator, comma as decimal separator). The VAT line in the total card shows the weighted rate; with mixed rates, show a separate line per rate.

Payment terms. Repeater of 1 to 3 term cards with `pct`, `moment` and `toelichting`. The amount per term is calculated ($\text{pct\%} \times \text{total_incl}$, 2 decimals; the last term is the remainder so the sum is exact) and rendered as "Bij akkoord: € 1.747,50". Validation: percentages must sum to 100.

Checklist "Inbegrepen bij jouw investering". Repeater of 3 to 6 text lines with a check icon; defaults as in the reference.

7. Digital approval button

In addition to the PDF, every quotation gets an **online view with approval capability**. This is part of this phase.

Flow:

- When a quotation is created/sent, the system generates a unique, unguessable link (token, ≥ 128 bits of entropy): `.../offerte/{token}`. No login for the customer.
- The link shows the quotation in the browser: the same HTML template (making it responsive for mobile is a plus — most customer contact happens via WhatsApp on the phone), with a fixed approval bar on top or at the bottom: total amount + button **"Akkoord geven"** (give approval).
- Clicking opens a short confirmation screen: name field (pre-filled with `klant.naam`), mandatory checkbox *"Ik ga akkoord met deze offerte en de algemene voorwaarden"* (I agree to this quotation and the terms and conditions, linking to the T&C PDF), confirm button. Optional nice-to-have: drawing a signature on a canvas.

4. On confirmation the system records: name, date/time, IP address, user agent and a hash/version id of the quotation content (so it is provable which version was approved).
5. Then, automatically:
6. dashboard status → **Akkoord** (approved) and the quotation is locked (changes only via a new version/new number);
7. confirmation e-mail to the customer with the final PDF, in which a block is added to the approval page:
"Digitaal akkoord gegeven door {naam} op {datum} om {tijd}" (digitally approved by ... on ... at ...);
8. notification to info@vanuitambacht.nl (and if available in the dashboard: push/alert), because fast follow-up after approval is crucial for Vanuit Ambacht.
9. The link expires on `geldig_tm`. After the expiry date the page shows a friendly message with contact buttons (WhatsApp/e-mail) instead of the approval button; the quotation remains readable.

Template change: in the online view the real approval button replaces the static CTA buttons on the approval page; in the PDF the current static buttons (WhatsApp/e-mail) remain. The signature boxes stay in the PDF for customers who prefer to sign physically — both routes lead to the same "Akkoord" status.

Legal minimum: recording name + timestamp + IP + quotation version + explicit T&C consent is sufficient proof of acceptance for this order size; a certified e-signing service is not required.

8. Overflow behaviour and validation

- **Fixed page layout:** every section is a page of exactly 296.7 mm high with `overflow: hidden`. Text that does not fit silently disappears — therefore the input form must enforce limits (max lengths and counts as above) **and** there must be a live preview (the HTML in an iframe) so the user immediately sees what they will get.
- **Line items > 5 (or > ~1 page):** let the table continue on a follow-up page "Investeren (vervolg)" with a repeated table header; the total card, checklist, validity badge and payment terms always sit together on the last investment page. Page numbering ("x / y" in the footer) and the chapter numbers must then shift automatically — make these template-driven, not hardcoded.
- **Required fields:** quotation number, date, valid-until, customer name, town/city, e-mail address (needed for the approval flow), at least 1 line item.
- **The validity date** recurs in three places (badge on the investment page, terms line on the approval page, and the expiry of the approval link) — one source field.

9. Brand constants (not editable per quotation)

CSS variables sit at the top of the template and are the only place where colours are defined:

```
--green #3E4E36 · --green-soft #49593F · --green-deep #33412C · --charcoal #4A4A43 · --bronze #70624F · --sand #D6CFC2 · --sand-light #EAE5DC · --paper #F7F4EE · --ink #2E2E29 · --line #E3DDD2
```

Typography: Playfair Display (headings/serif) and Montserrat 300–600 (all other text). Note: the official brandbook typeface for "AMBACHT" is Ragna Regular (paid licence); Playfair Display is the approved substitute in this document. Should the Ragna licence be purchased, this is a single `@font-face` swap. The logo and brand mark are included in the template as transparent PNGs (cream variant for dark surfaces, green variant for white pages).

10. Acceptance criteria

1. A quotation generated with the sample data from chapter 3 is visually identical to the reference PDF (page format, colours, fonts, positions).
2. All customer, product and price data comes from the data model; no customer-specific text is hardcoded anywhere.
3. Page 3: sections, lines, stat tiles, diagram segments and infobox can be added, changed and removed via the form, and render correctly from 1 up to the stated maxima.
4. An uploaded photo of any size (tested with: portrait phone photo 3024×4032, wide 4000×2250, small 600×400) always fills its frame completely, without distortion, white edges or wrong orientation.
5. Line items can be added without limit; totals, VAT and term amounts are correct to the cent and in Dutch notation; `inbegrepen` lines show "Inbegrepen" and do not count.
6. With more lines than fit on one page, a correct follow-up page is created automatically with correct page numbering.
7. The PDF is generated without external network requests, is $\leq \pm 4$ MB and is named `Offerte-{number}-{customer name}.pdf`.
8. The live preview in the dashboard shows exactly what the PDF will be.
9. The approval link works on mobile and desktop; after approval the dashboard status is immediately "Akkoord", the quotation is locked, the customer automatically receives the confirmation PDF with the approval block, and Vanuit Ambacht receives a notification.
10. An expired approval link shows the quotation without the approval button, with a friendly message and contact options.

11. Phase 2 (later, do not build now): drafting quotations automatically from Plaud and Gmail

Vanuit Ambacht records customer calls via Plaud (transcribed) and corresponds via Gmail. In a later phase a **draft** quotation in the Vanuit Ambacht style must be generated from this automatically: an AI step reads the transcript and/or e-mail thread, extracts customer details, configuration and price agreements, and fills the JSON data model from chapter 3. The draft appears in the dashboard for review; Tim or Bram checks it and sends it.

What this means for the build **now** (the only requirement in this phase):

1. The JSON data model is the single entry point of the generator; there is an internal function or endpoint *"create draft quotation from JSON"* that is independent of the input form.
2. Every quotation can arrive as a draft and then be fully reviewed and edited in the form — the form is therefore also an editor for existing data, not just for new input.
3. Missing fields may arrive empty; the form then shows the defaults and validates only on sending.

12. Open decisions (to be agreed with Tim & Bram)

1. **Sending:** is downloading the PDF + copying the approval link sufficient, or should sending by e-mail/WhatsApp work directly from the dashboard?
2. **Status management:** are the statuses concept/verzonden/akkoord/verlopen sufficient, and should a quotation be duplicable ("new quotation based on previous one")? Recommendation: yes, plus an automatic

quotation number counter (format 0F - {year}{sequence}).

3. **Product library:** fixed articles with default description and price (outdoor kitchen variants, delivery, options such as fridge/tap) so lines are picked instead of typed?
4. **Notification channel on approval:** e-mail to info@ only, or also an alert in the dashboard/phone?
