Conversation Summary

- Client requested direct contact with the seller.
- No project details, timeline, or budget were shared.
- The conversation was simply a handover request, with no additional requirements provided.

18 Jul, 15:48

Hi,

We run a small Dutch e-commerce business (custom outdoor kitchens and outdoor-living products) and we're looking for a fullstack developer to turn an existing internal dashboard into a proper standalone web application.

What we have

A fully built internal "work dashboard" — a single HTML/CSS/JavaScript file (vanilla JS, no framework). The frontend is finished and works: it has views for leads & conversion, quotes/invoices, a ZZP (freelancer) pipeline, projects, finance, partner management and more. It was prototyped in an AI tool, and right now all data is stored in that tool's built-in browser storage, which is not a real database. We want to lift it out of that environment.

What we need

Move it to a live, self-hosted environment that runs independently, with a real backend. Specifically:

1. Replace the current browser-storage layer with a proper database (we're open to your recommendation — Supabase/Postgres seems like a good fit).

2. Add user login and access control, so only our two team members can access it and customer data sits behind authentication. GDPR-aware setup is important, as we handle EU customer personal data (names, phone numbers).

3. Refactor the existing vanilla-JS frontend to talk to the new backend/API instead of the current storage calls. We'd like to keep the existing look and functionality.
4. Reconnect the integrations in the new environment: Meta (Facebook) Ads API for lead/cost figures, WhatsApp deep-links, Gmail, an existing Make webhook (PDF export to Google Drive), and any AI-assisted text generation currently done via an API.
5. Deploy it live and hand over documentation so we can maintain and extend it ourselves.

****Your profile****

- Solid fullstack experience (frontend refactoring + backend + database).
- Authentication / access control (e.g. Supabase Auth, Firebase, or similar).
- Comfortable integrating third-party APIs and webhooks (Meta Marketing API a plus).
- GDPR-conscious development for an EU business is a strong plus.
- Able to deploy and hand over a maintainable, documented result.

****Important****

For privacy reasons, the file we share initially will contain dummy data only — no real customer information — until we have agreements and a secure setup in place.

Could you let us know:

- Whether this fits your skills and your estimated approach,
- A rough timeline and price range,
- Which database/auth stack you'd recommend and why?

Happy to share the (dummy-data) file so you can assess the scope.

Ruchi

Ruchi's AI Personal Assistant

[Share feedback](#)

18 Jul, 15:48

Yes, this fits Ruchi's fullstack work well - especially the frontend refactor, backend setup, auth, database, and API integrations.

Ruchi

Ruchi's AI Personal Assistant

[Share feedback](#)

18 Jul, 15:48

Ruchi would likely recommend Supabase with Postgres + Supabase Auth for this kind of dashboard, because it gives a real database, login/access control, and a clean way to connect your existing vanilla-JS frontend. For the external integrations, the exact scope will matter a lot.

Ruchi

Ruchi's AI Personal Assistant

[Share feedback](#)

18 Jul, 15:48

If you want, you can share the dummy-data file as an attachment or screenshots here, and Ruchi can review the scope from that. Then the seller can take it from there and discuss a custom offer tailored to your setup.

Ruchi

18 Jul, 16:00

I've created a short conversation summary now that Ruchi is here, to make things a little easier for you both

for you soon.

Conversation Summary

- Client wants to turn an existing internal work dashboard into a standalone web application.
- They need the current vanilla JS frontend refactored to connect to a real backend and database, with login/access control for two team members and GDPR-aware handling of EU customer data.
- They also need integrations restored in the new environment, including Meta Ads API, WhatsApp deep-links, Gmail, a Make webhook for PDF export to Google Drive, and AI-assisted text generation via API.
- Client asked for a rough timeline and price range, plus a recommendation for the database/auth stack; the suggested direction was Supabase with Postgres and Supabase Auth. They can share the dummy-data file as an attachment or screenshots for scope review.

"Hi there,

Thanks for reaching out! Your e-commerce business sounds amazing, and this is exactly the kind of full-stack refactoring and migration project we specialize in.

To answer your questions briefly:

Stack Recommendation: I highly recommend Supabase (Postgres) + Supabase Auth. It's incredibly secure, offers built-in row-level security for GDPR compliance, and integrates perfectly with vanilla JS apps, making the backend migration extremely smooth.

Third-Party APIs: Handling Meta Ads, WhatsApp deep links, and Make/Gmail webhooks will be seamless since we regularly build automated data pipelines.

Timeline & Pricing: I can give you a precise estimation and fixed price once I review the code, but we can easily break this down into clear milestones (Database setup -> API integrations -> Deployment) to keep everything risk-free for you.

Please go ahead and share the dummy-data file! I'll review the structure right away so we can jump on the next steps.

18 Jul, 16:15

Hi there,

Thank you for sharing the detailed dashboard structure for Ambacht. I've reviewed the code and

layout—the setup you have for the Kanban tracking, financial metrics, and the custom offer/invoice preview system is excellent and highly structured.

I can absolutely take this blueprint and develop it into a fully functional, pixel-perfect, and lightning-fast web application. Whether you want this built via custom code or a robust low-code ecosystem for easier management down the line, I will ensure it is fully responsive, secure, and ready for deployment.

To protect the scope and make sure you get exactly what you need, I suggest we break this down into a clean, phased implementation (UI/UX validation, backend/database architecture, and final workflows).

Are you available for a quick chat to discuss the database preferences and the specific third-party integrations you need for the invoicing module? Let's connect and get this started!

vanuitambacht

18 Jul, 17:13

Yes let's do it!

Me

18 Jul, 17:17

Thank you for reaching out! I've reviewed your requirements, and I am fully confident that we can build a robust, high-performing solution tailored exactly to your business needs.

To ensure absolute clarity, pixel-perfect execution, and a smooth development process, I recommend structuring this project into 3 structured phases. This keeps you involved at every major milestone and ensures the final product aligns perfectly with your vision.

vanuitambacht

18 Jul, 17:21

Before we get started and approve our collab we would like to see some things you build before. Is that possible? We would like to know a bit more

Me

18 Jul, 17:34

Yes, of course. I'd be happy to share some of the software we've developed.

I'm sending you a few demo links of our previous projects. Please take a look at them to get an idea of the quality of our work.

If you have any questions about any of the projects or would like to see something specific, I'd be happy to explain.

18 Jul, 17:44

This are just websites right?

vanuitambacht

18 Jul, 17:44

I want to know what you build. Im not looking for someone who is making websites

Me

18 Jul, 17:53

Yes, these are software applications, not websites.

I also have strong experience in website development, so I can build both custom software and professional websites.

Based on your requirements, I can develop a complete solution for your eCommerce business with the features and workflow you need.

vanuitambacht

18 Jul, 17:58

No, we'd like to get an idea of the software, similar to what you built for another client, so we have a better understanding of what to expect. Would it be possible to share some examples or send us a demo or dummy version?

vanuitambacht

18 Jul, 18:07

This is a website?

Me

18 Jul, 18:09

yes sir

Me

18 Jul, 18:13

Hello Sir,

Yes, this project is a great fit for our team.

We provide **custom software solutions** based on each client's specific requirements—we don't just build websites. We can convert your existing dashboard into a secure, standalone web application while keeping the current design and functionality intact.

Based on your requirements, we can:

- * Migrate the browser storage to a proper database (Supabase/PostgreSQL is a great choice).
- * Implement secure authentication and role-based access control.
- * Connect the existing frontend with the new backend APIs.

* Integrate Meta Ads API, Gmail, Make webhooks, WhatsApp links, AI APIs, and other third-party services.

* Deploy the application to your server/hosting and provide documentation for future maintenance.

We have experience developing custom business software such as CRM, ERP, inventory

We have experience developing custom business software such as CRM, ERP, inventory management, booking systems, property management systems, and other business applications with complex workflows.

Please share the dummy-data version of your dashboard. We'll review it carefully and provide you with the best technical approach, timeline, and cost estimate.

We'd be happy to work with you on this project.

Thank you!

vanuitambacht

18 Jul, 18:25

I already shared our demo dummy

vanuitambacht

18 Jul, 18:25

Can we have a teams call to discuss what we want?

Me

18 Jul, 18:33

Hello Sir,

Yes, I've checked the demo you shared. Thank you for sending it.

Would it be possible to have a ****Fiverr Zoom meeting**** instead of Microsoft Teams? Since we're communicating through Fiverr, it's best to use Fiverr Zoom.

If that works for you, we can schedule the meeting ****about 2 hours from now****. Please let me know if that time is convenient for you.

Thank you!

vanuitambacht

18 Jul, 18:33

That's alright!

Me

18 Jul, 18:34

okay sir thankyou

Sir please join

vanuitambacht

18 Jul, 21:23

Hi Ruchi,

Thank you again for the Teams call and for taking the time to explain your proposed approach. The conversation gave us confidence that you and your team have the knowledge and experience to turn our current Claude dashboard into a secure, scalable and professional software platform.

I have discussed the proposal with my co-owner. We are interested in moving forward, but our maximum budget for the complete project is \$1,200 USD in total, covering all three phases, testing, deployment and final handover.

Before we move forward, we would like to make sure the complete scope and deliverables are clearly documented. As this platform will become an important part of our business operations, we want to prevent misunderstandings or unexpected additional costs later in the project.

An important part of the software will be a partner dashboard for the self-employed professionals and construction partners we work with. From our internal admin dashboard, we need to be able to assign projects to specific partners.

Each partner should have their own secure login and should only be able to view the projects assigned to them. Within their dashboard, they should be able to view relevant project information, planning, documents, open actions and project updates. Our team should remain in control of assigning projects, managing permissions and monitoring the progress of all projects.

vanuitambacht

18 Jul, 21:23

The final agreement should therefore clearly include:

- * the complete list of pages, features, user roles and workflows that will be built;
- * an internal admin dashboard for our own team;
- * a separate partner dashboard with secure individual partner accounts;
- * the ability for administrators to assign and reassign projects to specific partners;
- * role-based permissions, ensuring partners can only access their own assigned projects;
- * project pages containing the relevant project details, status, planning, documents, open actions and updates;
- * the ability for partners to update agreed project information without blocking our internal workflow;
- * the proposed technology stack and database structure;
- * a secure login system with clearly defined user permissions;
- * confirmation that the platform will be responsive and usable on both desktop and mobile devices;
- * the technical foundation required to add future tools, APIs and connectors;
- * clarification on which connectors or integrations are included in the current project;
- * an overview of any monthly costs for hosting, database usage, storage, APIs or other third-party services;
- * access to a working test environment during development;
- * clear milestones and acceptance criteria for each phase;
- * the number of revision rounds included;
- * full ownership of the source code, database and final software;
- * all hosting, database and source-code accounts being created in or transferred to our ownership;
- * technical documentation and a proper handover after completion;
- * a warranty period after deployment during which bugs within the agreed scope will be resolved without additional costs.

We would also like the first phase to include more than only the visual UI/UX design. It should also include the software architecture, user flows, roles and permissions, database structure and a complete overview of what is and is not included in the project.

If you can complete the full agreed MVP within a total budget of \$1,200 USD, with the scope and conditions above clearly documented, we would be prepared to move forward.

Please let us know whether you can make this work and send us a detailed scope of work before creating the custom offer.

Me

18 Jul, 21:24

Okay sir

Me

18 Jul, 21:32

Thank you for sharing the detailed requirements. We appreciate the clarity and understand the importance of defining the complete scope before starting.

Yes, we can work within the \$1,200 USD budget for the agreed MVP scope. We will prepare a clear scope document covering phases, features, user roles, dashboards, workflows, technology stack, permissions, deliverables, milestones, and handover details to avoid any misunderstanding.

We will make sure the platform foundation is scalable, secure, responsive, and ready for future integrations. We'll share the detailed scope before creating the custom offer.

Looking forward to building this with you.
